Ai.cook user Stories

- I want to be able to add (and remove) to **My Cupboard** the ingredients that are available on my kitchen from an ingredient's set, as well as their respective quantity.
- I want to be able to create, edit and remove from **My Cupboard** customized ingredients that are not available on the predefined setlist.
- I want to be able to select and save into my profile my dietary preferences, either from a tag setlist or create them if not available.
- I want to be able to have ai generated recipes with my available ingredients, preferences and cooking time[1] as an input.
- I want to be able to plan daily, or weekly meal plans with ai generated recipes, having the possibility to be assisted on organizing them on my calendar[2].
- I want to be reminded by the app when I'm running out of some ingredient (*implement the logic to automatically calculate and save the quantity of an x ingredient the user has after using y quantity for a recipe the ai generated*), and to have the possibility to add a reminder to my calendar for buying more.
- I want to be able to share to **My Cooking Community** snapshots of recipes I prepared.
- I want to be able to view and save recipes other users from **My Cooking Community** prepared, as well as the ingredients and steps involved.
- Finally, I want to be able to acknowledge how my data is handled, as well as which type of push-notifications I want to receive from the app.

[1.] A potential pro feature would be that the user can schedule on the calendar how much time does she/he has on individual weekdays so it can be taken as an input for generating time calculated recipes from the ai.

[2.] Developer should implement a functional calendar that can send push-notifications to the user.
